

Create Handler Class to Process Callback from Workflow Process

SAP Build Process Automation — ABAP Environment Workflow Integration

Overview & Objectives

In this tutorial, you will create an ABAP class to handle callbacks from **SAP Build Process Automation (SBPA)** back into the **SAP BTP ABAP Environment**. When a workflow decision (Approve or Reject) is submitted in SBPA, the workflow Action triggers an HTTP callback to this ABAP handler class to update the RAP Travel BO status in the backend.

Prerequisites

- Configured SAP BTP ABAP Environment system access with ABAP Development Tools (ADT).
- Created and configured the RAP Travel Business Object application (`RAP110` series).
- Created, released, and deployed the workflow project in SAP Build Process Automation.

Step 1: Create an ABAP Class in ABAP Development Tools (ADT)

1. In ADT, open your project package (e.g., `ZRAP110_###`).
2. Right-click on your package and select **New > ABAP Class**.
3. In the creation wizard, specify:
 - **Name:** `ZCL_RAP110_WORKFLOW_HANDLER_###`
 - **Description:** `Workflow Callback Handler Class`
4. Click **Next**, select a transport request, and click **Finish**.

Step 2: Add Interface and Implement HTTP Service

Implement the HTTP extension interface `IF_HTTP_SERVICE_EXTENSION` to allow the class to handle incoming REST/HTTP requests triggered by SBPA actions.

```

CLASS zcl_rap110_workflow_handler_### DEFINITION PUBLIC FINAL CREATE PUBLIC . PUBLIC SECTION.
INTERFACES if_http_service_extension . PROTECTED SECTION. PRIVATE SECTION. ENDCLASS. CLASS
zcl_rap110_workflow_handler_### IMPLEMENTATION. METHOD
if_http_service_extension~handle_request. DATA: lv_request_body TYPE string, lv_workflow_id
TYPE string, lv_outcome TYPE string. " Extract JSON payload from incoming HTTP POST request
lv_request_body = request->get_text( ). " Parse workflow metadata and update status via Entity
Manipulation Language (EML) " ... EML MODIFY ENTITIES OF zrap110_i_travel_### ... response-
>set_status( i_code = 200 i_text = 'OK' ). response->set_text( 'Workflow callback processed
successfully' ). ENDMETHOD. ENDCLASS.

```

Step 3: Update Travel BO Status via EML

1. Inside the `handle_request` method, parse the incoming JSON payload containing the `WorkflowInstanceId` and `Outcome`.
2. Use **EML (Entity Manipulation Language)** statement `MODIFY ENTITIES OF ZRAP110_I_TRAVEL_###` to update the overall travel approval status (e.g., set to *Accepted* 'A' or *Rejected* 'X').
3. Execute `COMMIT ENTITIES` to persist changes into the database tables.
4. Save and activate (`Ctrl + F3`) the handler class.
