

Release and Deploy Business Process Project

SAP Build Process Automation — ABAP Environment Workflow Integration

Overview & Objectives

To run a Business Process Project in **SAP Build Process Automation (SBPA)**, you must first **release** and **deploy** it.

- **Release:** Creates an immutable snapshot or version of your project using semantic versioning (`X.Y.Z`).
- **Deploy:** Publishes the released version into the runtime environment and configures operational parameters (such as BTP destination variables).

Prerequisites

- Created a Business Project and Process in SBPA.
- Created a Process Trigger and Data Type.
- Configured an Approval Form step.
- Created and configured a callback Action in the process flow.

Semantic Versioning Rules for Release

When releasing subsequent updates of an existing project, SBPA uses semantic version control (`X.Y.Z`):

Version Upgrade Type	Version Format Affected	Description / Typical Use Case
Bug Fix	<code>Z</code> (Third digit)	Patch updates or minor bug fixes that do not change functionality.
Minor Changes	<code>Y</code> (Second digit)	Small feature additions or incremental modifications.
Major Changes	<code>X</code> (First digit)	Incompatible or breaking structural modifications in the workflow.

Step 1: Release the Business Process Project

1. In the Process Builder header for `RAP110_Travel_Workflow`, click **Release** (top right corner).
2. In the release dialog, enter optional **Version Notes / Comments**.
3. Click **Release**. Since this is the initial release of the project, the version defaults to `1.0.0`.
4. Upon successful release, the project status changes to *Released* and is now ready for deployment.

Step 2: Deploy the Released Business Process Project

1. From the released version screen in Process Builder (or via the SAP Build Lobby), choose **Deploy**.
2. Select the target environment: **Public**, then click **Deploy**.
3. **Configure Runtime Variables:**
 - In the runtime variables prompt, select the callback destination (e.g., `abap-cloud-dev-steampunk-canary`) for the `CallBack_Destination` variable created in BTP Subaccount.
 - Runtime variables allow passing environment-specific values (like destinations or endpoints) to automations and process actions.
4. Click **Deploy**. The system will deploy the project (progress and status are visible in the Design Console).
5. Once deployed successfully, the workflow is active and ready to be triggered programmatically from the SAP BTP ABAP Environment.

Test Yourself / Quick Quiz

Q: Before calling the Workflow Process from BTP ABAP Environment, what action needs to be performed?

- ☒ **Deploy the process.** (*The released version must be actively deployed with configured destination variables before execution.*)
- ☐ Work on the task.
- ☐ Monitor the process.
- ☐ Run the process.
