

# Run, Monitor, and Troubleshoot SBPA Workflow Integration

SAP Build Process Automation — ABAP Environment Integration Guide

## Overview & Objectives

This guide walks through executing, monitoring, and troubleshooting end-to-end workflow interactions between **SAP Build Process Automation (SBPA)** and the **SAP BTP ABAP Environment**. You will learn how to trigger workflows, inspect runtime execution logs, handle errors, and verify RAP Travel BO status updates.

### Prerequisites

- Completed setup of RAP Travel BO with action triggers.
- Deployed workflow process in SBPA control tower.
- Configured callback handler class `ZCL_RAP110_WORKFLOW_HANDLER_###`.

## Step 1: Execute End-to-End Workflow Trigger

1. Open the SAP Fiori Elements Travel App preview from ABAP Development Tools (ADT).
2. Select a Travel record with status *Open*.
3. Click **Send for Approval** to trigger the SBPA REST API.
4. Confirm that the local Travel record status changes to **In Approval ('O')**.

## Step 2: Monitor Workflow Execution in SBPA

---

1. Navigate to the **SAP Build Process Automation Lobby** and select **Monitoring**.
2. Go to **Process and Workflow Instances** to locate your triggered workflow instance.
3. Verify the current stage in the execution diagram (e.g., waiting on user task in *My Inbox*).
4. Open **My Inbox** application in BTP, review task details, and click **Approve** or **Reject**.

## Step 3: Verify RAP BO Status Update & Callback

---

1. Return to the Fiori Elements Travel application in ADT or browser.
2. Refresh the Travel record list.
3. Verify that the status has been updated to **Accepted ('A')** or **Rejected ('X')** via the callback handler class execution.

## Step 4: Troubleshoot Integration Issues

---

- **Failed Process Instances:** Check *Monitoring > Process and Workflow Instances* filter for *Erroneous* status to inspect failure step logs.
- **HTTP / Destination Errors:** Verify BTP Destination configuration, authentication credentials, and endpoint URLs connecting the ABAP System and SBPA API.
- **Callback Failures:** Inspect ADT application logs or Gateway traces if the HTTP callback handler fails to execute EML state modification.
